Jacques Dumais and Lionel G. Harrison. 2000. Whorl morphogenesis in the dasycladalean algae: the pattern formation viewpoint. *Phil. Trans. Roy. Soc. Lond. B* 355, 281-305.

Due to difficulties in the printing process some of the figures of our article were altered or not satisfactorily reproduced. The most problematic cases are presented here. The legends for these figures still apply.

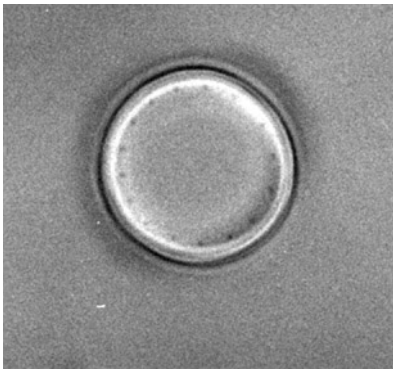

Figure 3a. This figure was altered by the printers to improve the visibility of the lysis pits. The original micrograph is reproduced with improved contrast.

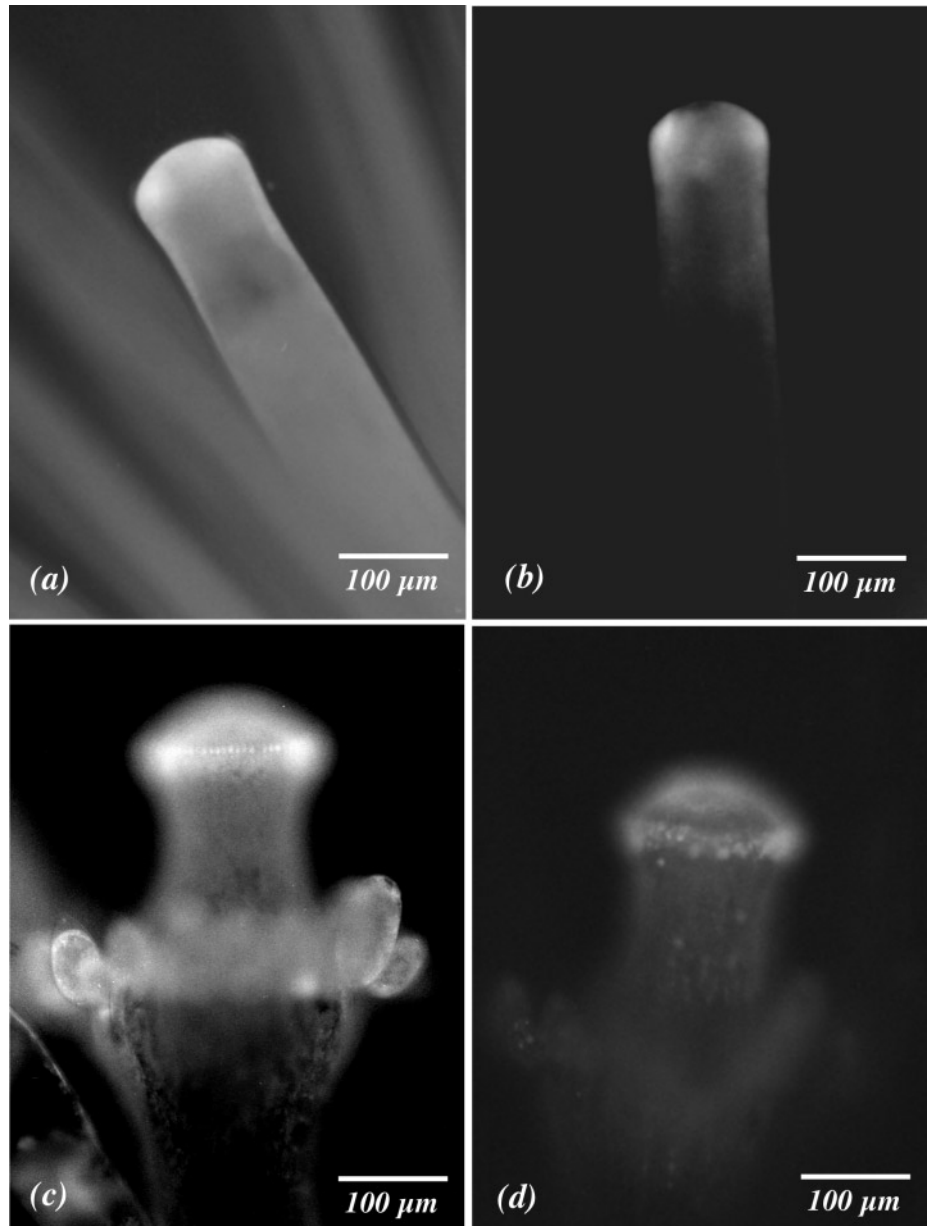

Figure 21. Many features of the fluorescence patterns were lost in the published version. In particular, the high fluorescence of the young cap appendages (Fig. 21c) was not visible. It is seen here as a string of bright spots running across the flattened tip. The randomly distributed spots in Fig. 21d are also more clearly visible in this micrograph. They result from an uneven distribution of chloroplasts.
